```
New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral
Wood WI;
    Van Lookeren M, Williams PM,
```

```
The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antifinated by it. A protein of the invention has antifinated to, antichabetic, dermatological, antipsoriatic, antiallergic, costeopathic, antidiabetic, dermatological, antipsoriatic, antiallergic, antiasthmatic, hepatotropic, and respiratory activity. A polymucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the agonist, antagonist, or antibody that specifically binds to the collopathic inflammatory myopathy. Signathropathy, systemic sclerosis, it is systemic arthritis, a spondyloarthropathy, systemic sclerosis, andiopathic inflammatory myopathy. Signar syndrome, systemic sclerosis, antidopathic inflammatory myopathy, Signar ansemia, autoimmune contained, thrombocytopenia, throiditis, diabetes mellitus, immune-mediated renal chsease, a demyelinating disease of the central or peripheral nervous cystem, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, system, idiopathic demyelinating polymeuropathy, Guillain-Barre syndrome, confisease, infectious or autoimmune chronic active hepatitis, primary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease, gluten-sensitive enteropathy, Mhipple's cisease, asthma, allergic rhinitis, atopic dermatitis, food disease, asthma, allergic rhinitis, atopic dermatitis, produced sensibility prememonia, idiopathic pulmonary fibrosis, hypersensitivity, uriticaria, an immunologic disease, of the lung, consinophilic pneumonia, idiopathic pulmonary fibrosis, hypersensitivity.

                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel polymucleotide and polypeptide sequence for the antigen detected by the antibody MCA 44-3AG. This antigen is designated Labyrinthin (lab). Antibodies directed to the Labyrinthin (lab) are useful in diagnostic assays for cancer, e.g. to monitor the presence and amount of antibodies (this method is especially useful for accept and analyse). As the Lab gene is not tissue-specific, it that have the Lab marker). As the Lab gene is not tissue-specific, it will detect cancer regardless of which organ it occurs in. Peptides cancer and/or to treat humans with cancer. Antibody MCA 44-3A6 is able to differentiate antigens associated with adenocarcinomas. However, the conference of the antigens associated with adenocarcinomas in cancer sequence of this antigen would enhance its usefulness in cancer cancer antigens associated with settliness in cancer attigen artigen would enhance its usefulness in cancer cancer attigen expension of the polypeptide and polymucleotide sequence of this antigen would enhance its usefulness in cancer attigen sequence of this antigen recognized by the MCA 44-3A6 antibody. This sequence of the antigen recognized by the MCA 44-3A6 antibody. This sequence and the number of the polymetric and prevention. The present invention discloses the sequence and the number of the number of the method of the cancer sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     664
                                                                                         The invention describes an isolated polynuclectide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynuclectide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynuclectide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein fragment, described in the method of the invention. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a polynucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in comprising a sequence selected from any of the 14 sequences mentioned in specification, considered in specification, considered in specification, considered in specification, considered in sequences that hybridise to 31, sequences having 75%, preferably considered in the specification of soluted and one of isolated polypeptide (comprising a sequence from any one of isolated polypeptide (comprising a sequence shaving at least 70%, concerned by the polynucleotide, or sequences having at least 70%, conferably 90% identity to a sequence encoded by the polynucleotide, and sequence concerned by the polynucleotide operably linked to an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the vector, an isolated antibody (or its antigen-binding fragment) that the patient, a fusion protein comprising the polypeptide, an oligonucleotide that hybridises to 31 under moderately stringent conditions, stimulating and/or expanding T cells specific for a tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                     784

correctin (comprising contacting T cells with the polynucleotide, protein correcting cells, under conditions and for a time sufficient content the stimulation and/or expansion of T cells) and inhibiting the development of a cancer in a patient (by incubating CD4*+ and/or CD8*+ T cells isolated from a patient with the polynucleotide, protein or antigen presenting cells that express the polynucleotide, such that T cells proliferated T cells, and thus inhibiting the development of the proliferated T cells, and thus inhibiting the development of a cancer in the patient. The polynucleotide, protein and scills are useful in a composition for stimulating an immune response in a patient, and for cligonucleotide is useful for determining the presence of a cancer in compositions, e.g. vaccines. The polynucleotide is a set useful in pharmacentical compositions, e.g. vaccines. The polynucleotide is also useful as a probe or primer for nucleic acid hybridisation, and in the design and proteins in tunour cells. An amplified portion of tunour preparation of ribozyme molecules for inhibiting expression of tunour colls in the present sequence is a cDNA, (full length gene from a suitable planary. The present sequence is a cDNA, (full length gene from a suitable planary. The present sequence is a cDNA, (full length gene from a suitable partial) isolated from a library derived from lung tunour/cancer cells. Note: The sequence date for this patent did not form part of the printed sequence date for this patent did not form part of the printed sequence. The present did not form part of the printed sequence is a cDNA, sequence for mated in electronic format directly from the construction, but was obtained in electronic format directly from the

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer

The invention relates to novel compositions and methods for the therapy and diagnosis of cancer, particularly lung cancer. The compositions comprise one or more lung tunnour polypeptides, immunogenic portions theref, polynucleotides that encode such polypeptides, antigen presenting cells that express such polypeptides, and T cells that are specific for cells expressing such polypeptides. The novel compositions have cycostatic and immunostimulant activity. The lung tunnour antigens can be used in the creation of a vaccine. The polynucleotides that encode the lung tunnour polypeptides can be used in gene therapy to help in the treatment of lung tunnours. This polynucleotide sequence represents a treatment of lung tunnours. This polynucleotide sequence represents a treatment of lung tunnours. This polynucleotide sequence vas not human lung tunnour cDNA clone of the invention. This sequence was not shown in the specification. It has been taken from a World Intellectual Property Organization CD ROM supplied with the specification.

The invention relates to a novel isolated polynucleotide comprising a sequence chosen from any one of 40 lung tumour polypeptides or its complements, fragments or degenerate variants. The method of the invention has cytostatic applications and may be useful for detecting and treating lung cancer in a patient, as well as for inhibiting the development of lung cancer in a patient via incubating COH+ and/Or COB+ polypeptide, polynucleotide or antigen presenting cell (APC) of the invention and administering an effective amount of the proliferated T cells to the patient. The current sequence is that of the human lung cancer—related CDM, of the invention. The current sequence is not shown in the specification per se but is available on the USPTO web-site http:seqdata.uspto.gov/sequence.thml?DocID=20030211510.

```

The present invention relates to the isolation of human protein modification and maintenance molecules (PWMM), and the polymucleotide sequences encoding them. A total of 40 PMMM polypeptides (designated PMMM - 1 to PMMM-40) are disclosed. The sequences of the invention are useful for diagnosing a condition or disease associated with the expression of PMMM in a subject, preparing a polyclonal or monoclonal antibody, and

generating an expression profile of a sample containing the polynucleotides. The diseases or conditions associated with decreased expression or overexpression of Phym are cell proliferation disorders (e.g. cancer, atherosclerosis), neurological disorders (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory disorders, (e.g. AIDS, allergies), developmental disorders (e.g. hypothyroidism, Cushing's allergies), gastrointestinal or epithelial disorders, and infections. The Phym polypeptides or their fragments are useful in screening compounds for effectiveness as agonists or antagonists of the polypeptides, or in altering the expression of the target polynucleotide and compounds specifically bind to, or modulate the activity of the polypeptide. ACA92416-ACA92455 encode the human PWMM polypeptides of the invention

through the I.W.A.G.B. Consortium/LLNL at: http://image.llnl.gov Series: IRAL Plate: 42 Row: n Column: 19
This clone was selected for full length sequencing because it massed the following selection criteria: matched mRNA gi: 14589865
This clone has the following problem: The cds is short compared to the longest cds in the locus.

This family includes the N-terminal regions of the junctin, junctate and aspartyl beta-hydroxylase proteins. Junctate is an integral BR/SR membrane calcium binding protein, which comes from a lternatively spliced form of the same gene that generates aspartyl beta-hydroxylase and junctin. Aspartyl beta-hydroxylase the post-translational hydroxylation of aspartic acid or asparagine residues contained within epidermal growth factor (BGF) domains of

are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

1 130383: contig of 130383 bp in length
130384 132868: contig of 2385 bp in length.
